HI,

I would like to request the following searches: SEQ ID NO:6 and 30 in the protein databases (commercial & interference).

Please provide a hard copy of this search.

Thank you very much,

Delia M. Ramirez, Ph.D. Patent Examiner Recombinant Enzymes-Art Unit 1652

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Fermentation of E. coli having an altered amino acid sugar metabolic pathway to produce glucosamine, especially using novel recombinant variant glucosamine-6-phosphate synthases.

Claim 28; Page 124-126; 150pp; English.

The present sequence is that of a mutant, denoted GlcN6P-S-54, of the glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli

When compared with the wild-type sequence (see AAV58822), the mutant includes A39T, R250C and G472S amino acid substitutions. These alterations are predicted from the mutated glms gene in plasmid pKLN23-54 (see AAZ58251). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially E. coli, that includes a modified GlcN6P synthase. Production of the glucosamine by recombinant strain 1213-54 (pKLN23-54) was significantly increased when compared to a strain expressing wild-type GlcN6P synthase owing to reduced product inhibition. Glucosamine concentrations of over 12 g/l have been obtained
                                                                                                                                                                                                9

The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (1) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate deaminase (IV), or decreases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (b) and collecting the product, which is chosen from the group consisting of glucosamine-6-phosphate, glucosamine-6-phosphate, n-acetylglucosamine-6-phosphate, and N-acetylglucosamine-6-phosphate, N-sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-6-phosphate amidotransferase (also known as glucosamine-fructose-6-glucosamine-6-phosphate synthase, and encoded by the GFA1 eukaryotic gene and the glmS bacterial gene), glucosamine-6-phosphate acetyltransferase (encoded by GNA1), chitin synthase or chitin deacetylase (encoded by CDA1
                                                                                                                                            480

```
and CDA2), or in decrease in the activity of N-acetylglucosamine-6-phosphate deaminase, chitinase and chitosanase, and collecting the chitin or chitosan. The method is useful for producing chitin or chitosan by utilizing microorganisms such as fungus, yeast (e.g. Saccharomyces or Schizosaccharomyces) and finamentous fungus (e.g. Aspergillus, Absaidia or Rhizopus), preferably Scerevisiae, A. niger or A. nidulans. The method enables high quantities of chitin and chitosan to be produced cost effectively. The present sequence represents a mutent glucosamine-6-phosphate synthase, encoded by glmSx54. This enzyme is resistant to feedback inhibition by glucosamine-6-phosphate. The polynucleotide was used to transform yeast for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of a mutant, denoted GlcN6P-S-151, of the glucosamine-G-phosphate synthase (GlcN6F synthase) of Escherichia coli. When compared with the wild-type sequence (see AAV58822), the mutant includes a Ser for Gly-472 amino acid substitution. This alteration was predicted from the mutant almo acid substitution. This alteration was predicted from the mutant of plans gene in plasmid parmid glucosamine by fermentation using a genetically engineered microorganism, especially Equicosamine by recombinant strain 213-149 (pkLN23-149) was marginally increased when compared to a strain expressing wild-type Glc6NP synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a mutant, denoted GlcN6P-S-149, of the glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli. When compared with the wild-type sequence (see AAY58822), the mutant includes a Ser for Gly-472 amino acid substitution. This alteration was predicted from the mutated glms gene in plasmid pXLN23-149 (see AAX5853). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially E. Coli, that includes a modified GlcN6P synthase. Production of the clucosamine by recombinant strain 212-149 (pxLN3-149) was marginally increased when compared to a strain expressing wild-type GlcGNP synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GGQLYVFADQDAGFVSSDNMHIIEMPHVEEVIAPIFYTVPLQLLAYHVALIKGTDVDQPR

The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (1) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (III) or glucosamine-6-phosphate deaminase (IV), or decreases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (b) and collecting the product, which is chosen from the group consisting of glucosamine-6-phosphate, glucosamine-6-phosphate, N-acetylglucosamine-6-phosphate, and N-acetylglucosamine-1-phosphate, N-acetylglucosamine-T-phosphate, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (I) Which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate strip synthase (III), or decreases the activity of (IV) and increases the activity of glucosamine-1 phosphate Activity of (IV) and increases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (b) and collecting the product, which is chosen from the group consisting of glucosamine-6-phosphate, N-acetylglucosamine, glucosamine-1-phosphate, N-acetylglucosamine-1-phosphate, and N-acetylglucosamine. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                The present sequence is that of wild-type glucosamine-6-phosphate synthase (GlcN6P synthase) of Escherichia coli strain W3110. The sequence is predicted from the isolated glmS gene (see AAZSB249) in plasmid pKLN23-28. Recombinant nucleic acids encoding GlcN6P synthase are claimed, and are used for the expression of the enzyme in host microbial strains, are used for the expression of the enzyme in host microbial strains, invention also provides methods for the overproduction of glucosamine using a genetically engineered microorganism that encodes a GlcN6P synthase modified to increase its activity (see also AMYS8823-27). Preferred modifications comprise amino acid deletion, insertion, inversion, derivatisation or substitution, especially 147, IZ727, A39T, R250C, G472S and L469P substitution, of the present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 EHPLHGGTGIAHTRWATHGEPSEVNAHPHVSEHIVVVHNGIIENHEPLREELKARGYTFV

The invention relates to antieense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes chemical their use in the discovery of novel antibiotics, the essential genes chemically sensed and the encoded proteins. The prokaryotes used are Escherichia cali, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, conservation of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify antibodies capable of binding to the express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid; (2) a host cell containing the vector; (3) an isolated only peptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that inhibits cellular proliferation or the activity of the gene product or that has an activity against a biological pathway required for proliferation or that inhibits cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies pathway in which a proliferation-equired gene or its gene product lies proliferation or the biological pathway in which a proliferation-equired gene or its gene product lies or a gene on which the test compound that inhibits proliferation of a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism. The atrigence or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids are quired for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids for this patent did not form part of the printed specification, but was obtained in nelectronic format directly from Wipo at formse directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               181 LEGALKLKEISYIHAEAYAAGELKHGPLALIDADMPVIVVAPNNELLEKLKSNIEEVRAR 540

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method (M1) for producing glucosamine and N-acetylglucosamine by fermentation. The method comprises (a) culturing in a fermentation medium a microorganism (I) which comprises endogenous glucosamine-6-phosphate acetyltransferase (II) and a genetic modification that increases the activity of (II), glucosamine-6-phosphate synthase (IV), or decreases the activity of (IV) and increases the activity of glucosamine-1 phosphate N-acetyltransferase (V), and (b) and collecting the product phosphate N-acetyltransferase (V), and (b) and collecting the product glucosamine, glucosamine-1-phosphate, N-acetylglucosamine-6-phosphate, N-acetylglucosamine-1-phosphate, and N-acetylglucosamine-Theosphate, n-acetylglucosamine-Theosphate, and N-acetylglucosamine. The present sequence was used to illustrate the method of the invention.

The invention features to a recombinant UnA construct compirating a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant with the transformed plant with the avoing an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the colynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or perts, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modified seed oil or protein yield and/or content, improved lighth production of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of carbohydrate, nitrogen or providing improved lighth production or improved galactomannan condition, improved lighth production or improved galactomannan condition, improved lighth production or improved galactomannan condition, improved lighth was obtained for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.thml.
                                                                                                                                                                                                                                New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                   invention relates to a recombinant DNA construct comprising a

```

The specification describes a method for producing chitin or chitosan by a fermentation process. The method involves culturing in a fermentation medium a microorganism which comprises one or more genetic modifications that result in an increase in the activity of glutamine-fructose-6-phosphate amidotransferase (also known as glucosamine synthetase and glucosamine-6-phosphate synthase, and encoded by the GFAI eukaryotic gene and the glms bacterial gene), glucosamine-6-phosphate acetyltransferase (encoded by GNAI), chitin synthase or chitin deacetylase (encoded by CDAI) and CDA2), or in decrease in the activity of N-acetylglucosamine-6-phosphate deacetylase, glucosamine-6-phosphate deaminase, chitinase and chitosanase, and collecting the chitin or chitosan. The method is useful for producing chitin or chitosan by utilizing microorganisms such as Producing chitin or chitosan, involves culturing microorganism with genetic modification that results in increase in activity of glutamine-fructos-6-phosphate amidotransferase, in fermentation medium, to produce Example 1; SEQ ID NO 23; 161pp; English. or chitosan. chitin

fungus, yeast (e.g. Saccharomyces or Schizosaccharomyces ) and filamentous fungus (e.g. Aspergillus, Absidia or Rhizopus), preferably Scerevisiae, A. niger or A. nidulans. The method enables high quantities of chitin and chitosan to be produced cost effectively. The present sequence represents an Escherichia coli glucosamine-6-phosphate synthase. It was used to transform, yeast for use in the method of the invention.
                                                                                                                                                                    9

New modified glutamine:fructose-6-phosphate amidotransferase, useful for identifying specific inhibitors, potentially useful for treating e.g. diabetes, contains a purification tag, also related nucleic acid.
                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel protein corresponding to human enzymatically active but modified glutamine:fructose-6-phosphate amidotransferase (GFAT). The invention may be useful for the production of compounds with an antidiabetic, anorectic, metabolic, cytostatic, osteopathic, fungicide or herbicide activity. The invention may be used to screen for agents that modify, especially inhibit, its activity, potentially useful as agents for treatment or prevention of diabetes (particularly type II), obesity, acidosis, ketosis, cancer and steeporosis. In addition inhibitors of plant and fungal GFAT may be useful as herbicides and fungalcides, respectively. The present sequence is that of a human GFAT-like protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DAGDKGIYRHYWQKEIYEQPNAIKNTLTGRISHGQVDLSELGPNADELLSKVEHIQILAC

The present sequence is that of a mutant, denoted GloN6P-S-124, of the glucosamine-6-phosphate synthase (GloN6P synthase) of Escherichia coli. When compared with the wild-type sequence (see AAY58822), the mutant includes a Leu-469 to Thr amino acid substitution. This alteration is predicted from the muated glmS gene in plasmid pKLN23-124 (see AAZ58252). The invention provides methods for the overproduction of glucosamine by fermentation using a genetically engineered microorganism, especially Ecoli, that includes a modified GloN6P synthase. Production of the glucosamine by recombinant strain 2123-124 (pKLN33-124) was significantly increased when compared to a strain expressing wild-type GloSNP synthase owing to reduced product inhibition
